

Sandesh Data Systems is a software provider in Chennai, India building advanced software solutions for the enterprise. Our software products enable organizations to provide good corporate governance. Our experience in healthcare, information technologies and high-tech manufacturing enables us to provide software products and services for:

- s Data Automation
- s Information Systems
- s Simulation Software
- s Document Management
- s Inventory Tracking
- s Performance Tracking and Process Monitoring

Our software products enable organizations to provide good corporate governance. Our line of products includes:

Medical Policy and Procedure Tracking Software (idTracks-Docs): idTracks-Docs, policy and procedure management software, is a secure, reliable enterprise application that is designed to streamline document workflow and manage document lifecycle. idTracks-Docs is a cost effective solution to manage all of your policies and procedures.

Medical Device Tracking Software (idTracks-Devices): idTracks-Devices is an enterprise device tracking application designed to improve the performance and quality of service in healthcare and manufacturing industries. The application monitors device location in the facility using wireless networking and tracks the device preventive maintenance tasks. It improves the device availability and helps manage the devices and meet compliance requirements.

Physician Order Set Management Application (POMA): POMA is an enterprise application to electronically create, distribute and maintain physician's orders. It is developed to organize, manage and access individual physician's orders over the intranet. POMA is an application for healthcare organizations for managing standard order sets customized to individual physicians.

idTracks-Gages: is a manufacturing gage and inventory tracking software. Tracking actual gage usage is important for gages that require calibration. Calibration is expensive and a gage that is held up in calibration may slow down or even stop certain operations on the manufacturing floor. idTracks-Gages can also track the jobs and products that used a specific gage. idTracks-Gages can help you take control of your gage management and gage maintenance tasks by tracking a gage checkout, usage and calibration operations. It can use barcodes or iButtons™ for tracking all the steps your gages go through in the warehouse and the factory floor. It is a flexible tool that can be configured to your factory operations and can save you thousands of dollars in gage calibration costs, manufacturing delay and rework costs.

Custom Software Development

We are a technology group that provides innovative IT solutions and specialized products that add real business value to your business. Our expertise encompasses operations and process consultancy, user experience, web design, applications development and deployment. We are result-focused. We know that our clients expect tangible benefits from integrated business solutions and that is what we deliver.

We match innovation with technology to build high value solutions that meet your business goals.
